Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the

application:

Listing of Claims:

1. (original):   An interconnection system for a plurality of processing elements (PEs),

each PE having a communications port for transmitting and receiving data and commands, the

interconnection system comprising:

inter-PE connection paths; and

a cluster switch connected to said PEs so as to combine mutually exclusive inter-PE

connection paths and to thereby substantially reduce the number of communications paths

required to provide inter-PE connectivity equivalent to that of conventional torus-connected PE

arrays.

44. (previously presented):   An array processor comprising:

a plurality of processing elements arranged in clusters, each cluster including processing

elements which communicate in mutually exclusive torus directions with the processing elements

of at least one other cluster; and

cluster switches connected to the clusters to provide said mutually exclusive torus

direction communication.

2

Appl. No. 10/036,789
Amdt. dated January 22, 2004
Reply to Office Action of October 22, 2003

45. (previously presented): The array processor of claim 44 wherein each cluster includes an equal number of processing elements.

46. (previously presented): The array processor of claim 44 wherein at least one cluster includes a torus transpose pair of processing elements.

47. (previously presented): The array processor of claim 44 wherein the cluster switches provide inter-PE connectivity equivalent to a torus connected array.

48. (previously presented): The array processor of claim 44 wherein the cluster switches provide direct communication between processing elements in a transpose processing element pair within a cluster.

49. (previously presented): The array processor of claim 44 wherein the clusters of processing elements are scaleable.

50. (previously presented): The array processor of claim 44 wherein the processing elements of each cluster are located in close physical proximity to each other.

51. (previously presented): The array processor of claim 44 further comprising a single instruction multiple data (SIMD) controller which broadcasts data to said plurality of processing elements.

52. (previously presented): The array processor of claim 51 wherein each processing element performs a calculation and transmits the results of the calculation to a nearest neighbor processing element.

53-56. (previously cancelled)

3

57. (previously presented): The array processor of claim 44 wherein the clusters of processing elements correspond to slices of a torus array shifted and wrapped into a cylinder.

58. (previously presented): The array processor of claim 44 wherein each processing element (PE) is defined as $PE_{i,j}$, where i and j refer to the respective row and column PE positions within a conventional torus-connected array, and where i = 0,1,2, ... N-1 and j = 0, 1, 2, ... N-1, said PEs arranged in clusters $PE_{(i+a)(ModN),(j+N-a)(ModN)}$, for any i,j and for all a $\in$ {0,1,...,N-1}.

59. (previously presented): The array processor of claim 44 wherein each cluster switch multiplexes communications from processing elements within a cluster for transmission to another cluster.
